SaveStreet Dogs

Replit Admin Panel & Shop Fix Prompt

PROMPT FOR REPLIT AGENT

Hey Replit, please inspect and fix my **existing SaveStreet Dogs website**. This request is ONLY for SaveStreet Dogs. Do not make changes to New National Advertising or any other project. Please do not rebuild the site from scratch or unnecessarily change its current design. I need the admin panel to work properly, and anything I add or edit in the admin panel must show correctly on the public SaveStreet Dogs website.

1. Connect the admin panel to the public website

- Use the project's existing Firebase/Firestore setup and current architecture. Check the actual data flow between admin forms, Firestore/storage, and the public website.
- When I add, edit, publish/unpublish, or delete puppies, shop products, stories, rescue reports, website content, or other existing supported records in the admin panel, save the changes persistently and reflect them on the matching public page.
- Remove broken hard-coded/demo-data dependencies where they prevent the website from displaying admin-managed records. Do not use temporary in-memory state or localStorage as the source of truth.
- Make admin forms simple for a non-technical person, with clear fields, image upload where needed, validation, loading states, and success/error messages.
- Check mismatched Firestore collection names, document fields, query filters, image paths, permissions, and stale caching that could stop saved content from appearing.

2. Fix product images in the Shop section

- Product photos are missing or not showing in the public Shop section. Find and fix the underlying cause.
- In admin product management, make it easy to upload or select the correct product image. Use the project's existing Firebase Storage or established persistent image-storage solution, then save the valid image URL/path in the product record.
- Render each product's correct image, name, and existing product information in the public Shop section. Keep the existing product data and images wherever possible; do not replace them with unrelated placeholders.
- Check image URL validity, storage access rules, and rendering behavior in both preview and the deployed website. Images must still work after refreshing the page.
- If the product supports multiple images, ensure the intended main image is displayed consistently and image failures are handled gracefully.

3. Test the /admin route and security

- Open the deployed SaveStreet Dogs website and test its direct /admin route. Use the actual current deployment URL from this Replit project; do not assume or invent a URL.
- Confirm /admin loads directly after entering the URL or refreshing, and fix route handling, redirects, and 404 errors.
- Test admin login, logout, and authorization. Only authorized administrators should be able to manage content. Keep Firebase Authentication and the existing admin-role/allowlist checks secure; do not bypass security to make the panel appear to work.
- Open every existing admin section and check for runtime errors, broken forms, missing records, and failed database/storage requests.

4. Test a real admin-to-website workflow

- Create a temporary test shop product from /admin, including a test name and an uploaded image. Save it and verify that the same product and photo appear on the public Shop page.
- Edit the test product and verify the updated data appears publicly. Delete the test product and verify it disappears from the public Shop page. Clean up the test record afterward.
- Where practical, repeat the workflow for one other content type, such as a puppy or story, to confirm the public page uses admin-managed data.
- Refresh /admin and the public pages and confirm changes persist. Inspect browser console, network requests, Firebase errors, Firestore rules, and Storage rules. Fix the root cause, not just the visible symptom.
- Do not claim a test passed unless you actually performed it. If a missing credential, permission, or deployment setting prevents testing, tell me exactly what is missing and how I can provide or configure it.

5. Final requirements and report

Keep SaveStreet Dogs responsive and preserve its current branding and working features. Make it straightforward to manage puppies/adoption content, Shop products, stories, rescue reports, and website content through the admin panel. Use the existing project architecture and avoid unnecessary rewrites. After the fixes, report what was broken, what you changed, the exact routes you tested, whether the product add/edit/delete test passed, and any remaining setup I need to complete.

Important: Work only in the SaveStreet Dogs project. The goal is a real, persistent admin-to-website workflow, including visible product photos, not just a better-looking admin screen.
